

Basic Help

Adobe Photoshop
version

Please note!

This is a general help file I have made for my Photoshop templates. The shown screenshots are not necessarily the same colors and content as in your downloaded Indesign file, however the steps and things to do are the same.

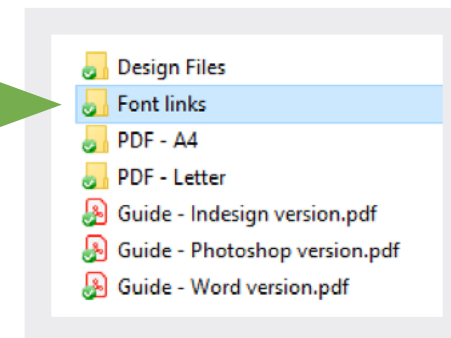

1

Install fonts

First thing to do is to install the fonts used in this brochure.

(If you want to use different fonts, see section 6 in this help file, on how to change fonts).

Go to the folder called '**Font links**'.

Double click each file in this folder, which will bring you to the download page for each of the fonts.

The fonts shown in this screenshot are just an example. You might have other font names here.

Download the fonts and install them on your computer.

2

Bleed or no bleed?

This document comes in two variants.

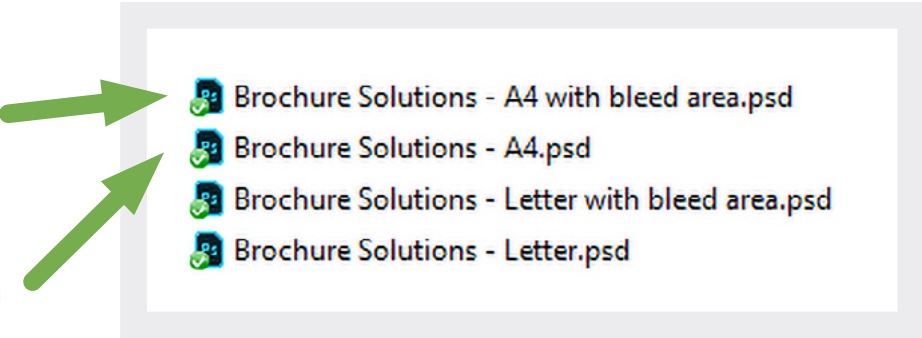

One with bleed and one without.

Choose the one best suited for your needs.

If you are planning to have this document professionally printed, you should use the one with bleed.

If you are planning to print the document on a home or business printer – or just use it as a PDF document, you should use the one without bleed.

If you are unsure what bleed is, you probably don't need it ;-)

3

Groups, layers and images

Each page is neatly organized in it's own group.

To edit text and insert images, find the appropriate group and layer. They are all named, so it should be easy to identify all layers.

Image placeholders are placed as smart objects. Double click the image placeholder to open the smart object.

Place your image, save and close the window.
Your image is now placed perfectly.
